Adolescent Development

Implications for professional driving instruction

Prof Teresa Senserrick & Dr Natalie Watson-Brown

ADTA Queensland Conference
Victoria Park, Brisbane

ACKNOWLEDGEMENT OF TRADITIONAL OWNERS

QUT acknowledges the Turrbal and Yugara, as the First Nations owners of the lands where QUT now stands. We pay respect to their Elders, lores, customs and creation spirits. We recognise that these lands have always been places of teaching, research and learning.

QUT acknowledges the important role Aboriginal and Torres Strait Islander people play within the QUT community.

Outline

Youth crash risk: what are we targeting?

Adolescent development: understanding risk

Implications for professional driving instruction of young learner drivers

Background

Casualty crash risk by years licensed

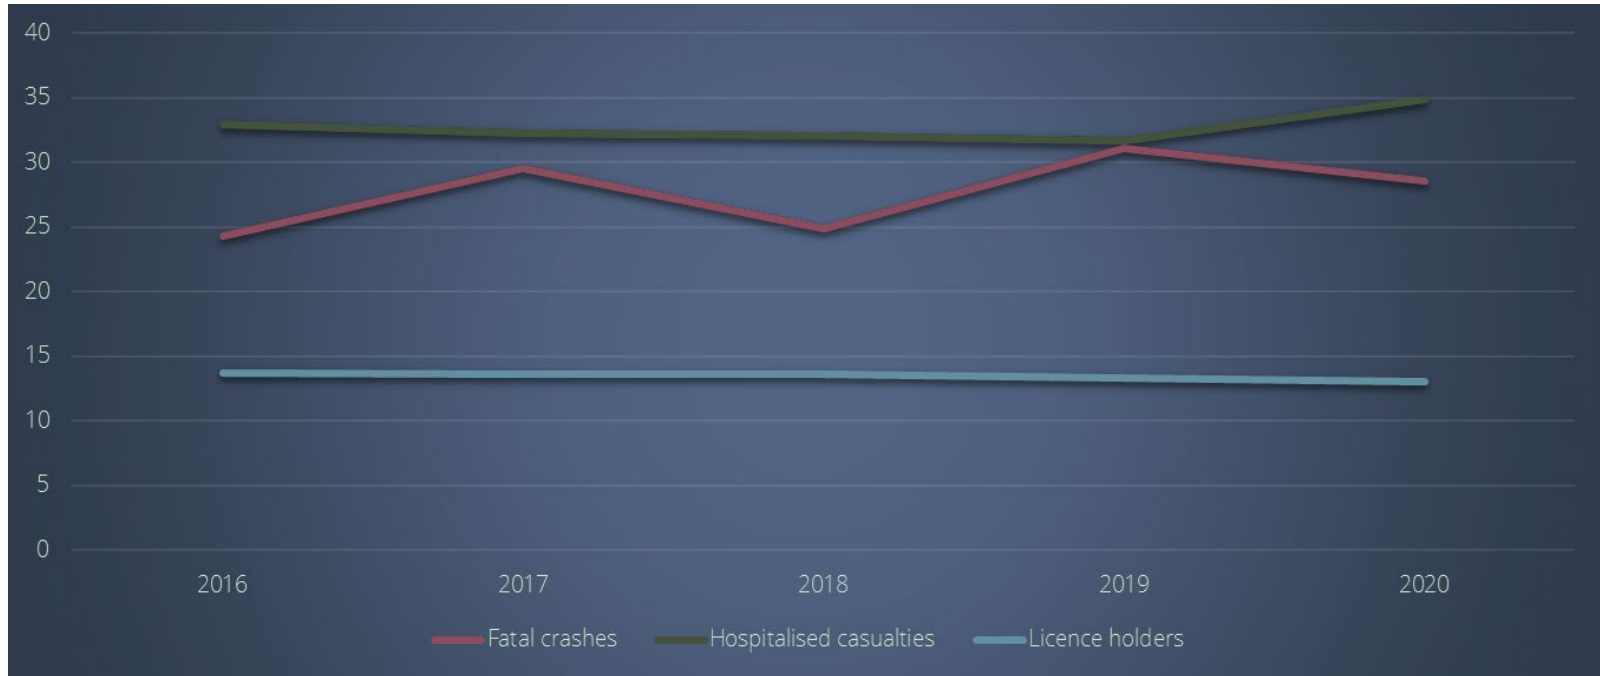

Crash risk by age licensed

5-year crash trends

Queensland Licence Holders: Aged 16-24 years

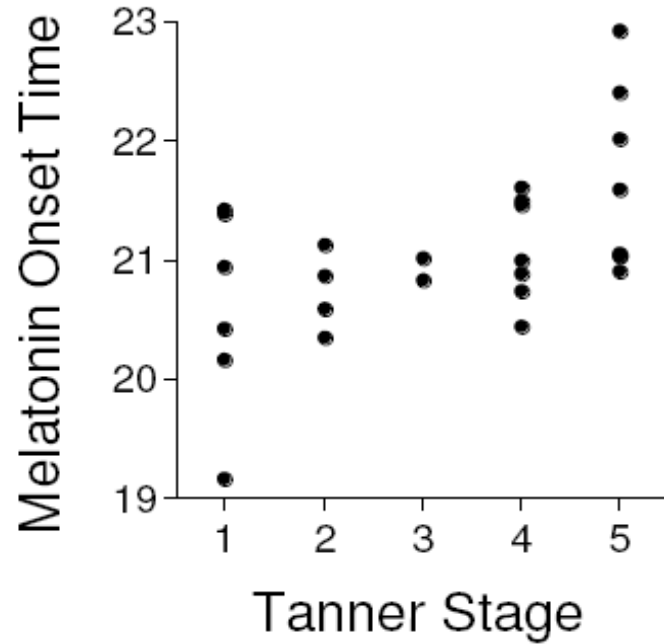

Developmental Factors

Brain development

Melatonin Onset Shift

Driving implications?

Overview of young novice driver crash causes

Biological aspects (Nature)	Age brain development	Gender	Personality	Physical and mental constitution
↕				
Norms, values/ competences (Nurture)	Youth cultures lifestyle	Peer group influences	Education	Socioeconomic and cultural background
↕				
Capabilities/acute impairments	Alcohol/drugs	Fatigue	Distraction/ inattention	Emotions
↕				
Hazard perception in traffic	Scanning	Detecting	Recognizing	Predicting
↕				
Risk awareness and task execution	Self assessment	Risk assessment Risk acceptance	Decision making/ action selection	Task execution
↕				
Task demands/ exposure	Speed/ vehicle	Traffic density	Road and road environment	(Weather) conditions

An aerial photograph of a city street with a crosswalk. A white car is stopped at the crosswalk. Several pedestrians are crossing the street. A semi-transparent circular graphic with a dashed border is overlaid on the car and the crosswalk. The overall image has a blue and purple color cast.

Adaptive Development

Role of experience

Role of environment

Higher risk, not high prevalence

Training Solution? Higher Order, Self-regulation

GDE

	Knowledge and skills	Risk-increasing factors	Self-evaluation and awareness skills
Level 4: Goals for life and skills for living	Personal tendencies that impact driving	Not accepting safe social norms, e.g., regarding drug use	Ability to recognise and control impulses
Level 3: Goals and contexts for driving	Trip planning, route choice	Poor driver condition, e.g., mood, medication	Personal planning skills, motives for safe vs risky driving
Level 2: Mastery of traffic situations	Road rules, safety margins	Driving skill deficits, e.g., in poor weather conditions	Awareness of personal driving style
Level 1: Vehicle manoeuvring	How to operate a vehicle, e.g., change gears	Not yet automating psychomotor skills for operating a vehicle	Realistic self-evaluation about vehicle handling capability

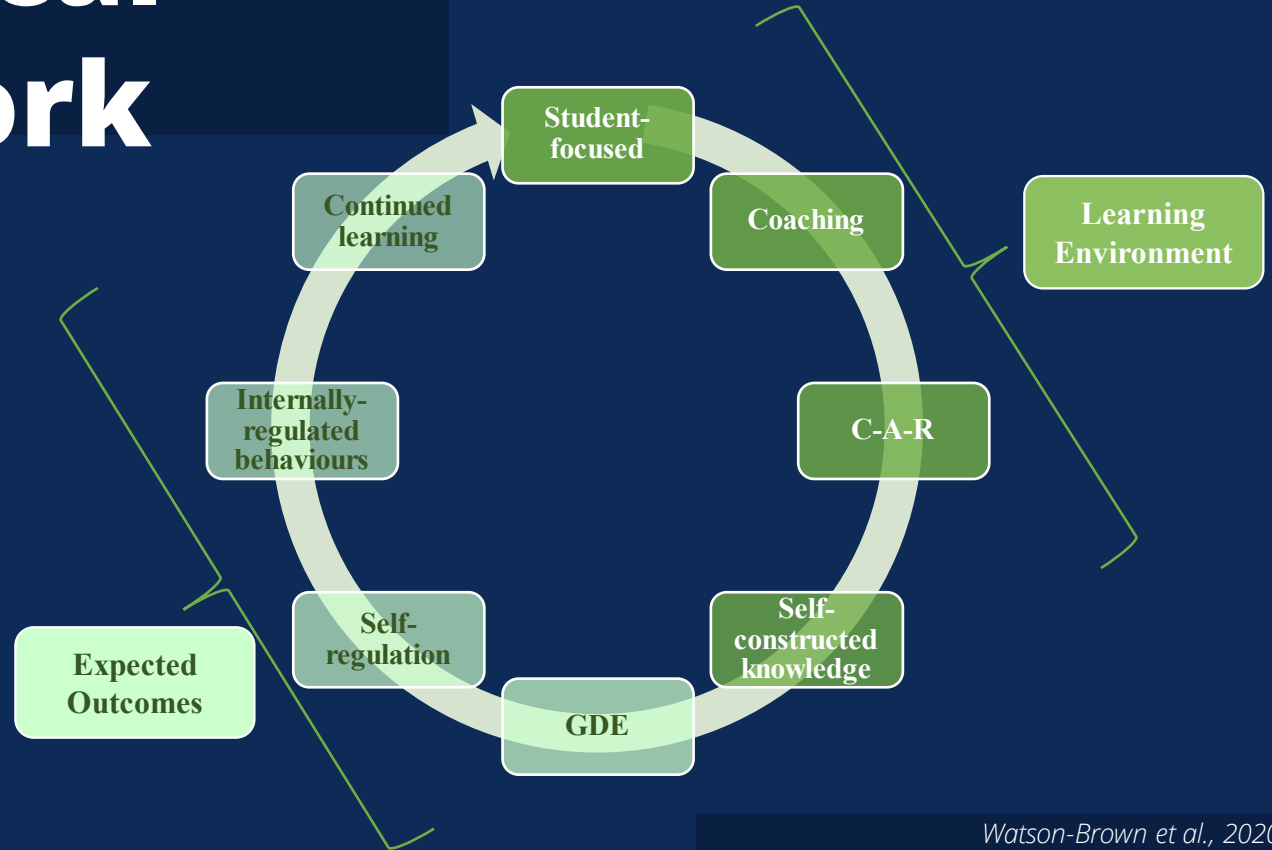

Self-determination theory

Type of Regulation	Non-regulation	External regulation	Introjected Regulation	Identified Regulation	Integrated Regulation	Intrinsic Regulation
Reason for Acting	None (no intent to act)	Reward or punishment	Others' approval or avoid guilt	Importance and value	Consistent with my goals and values	Inherently enjoyable / satisfying
What it means to driving	<i>Unintentional/habitual risky driving</i>	<i>Comply when enforcement is visible</i>	<i>Comply to avoid feelings of guilt</i>	<i>Value the safety of compliant driving behaviour</i>	<i>Driving safely aligns with other elements of the self</i>	<i>Driving safely is enjoyable</i>

Deci & Ryan, 2000 and Livitz et al., 2017.

Theoretical framework

Watson-Brown et al., 2020

Research

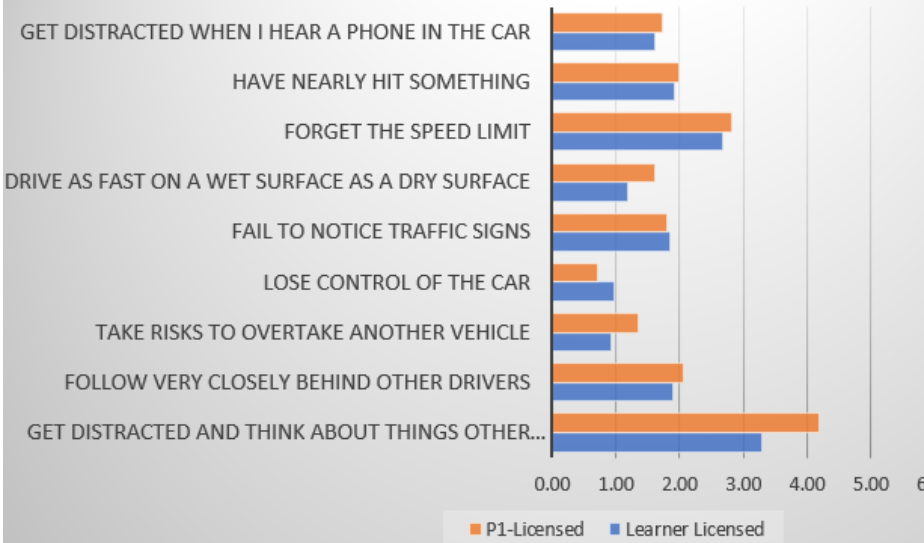

Survey >1,600 drivers age 16-19
– 1,038 L, 589 P

Naturalistic observation
110 professional driving lessons

Interviews 13 professional
driving instructors

Survey Results

Risky Driving Behaviour - Frequency

↑ Self-regulation = ↓ Risky driving
– intentional and unintentional

Influences L unintentional risky driving

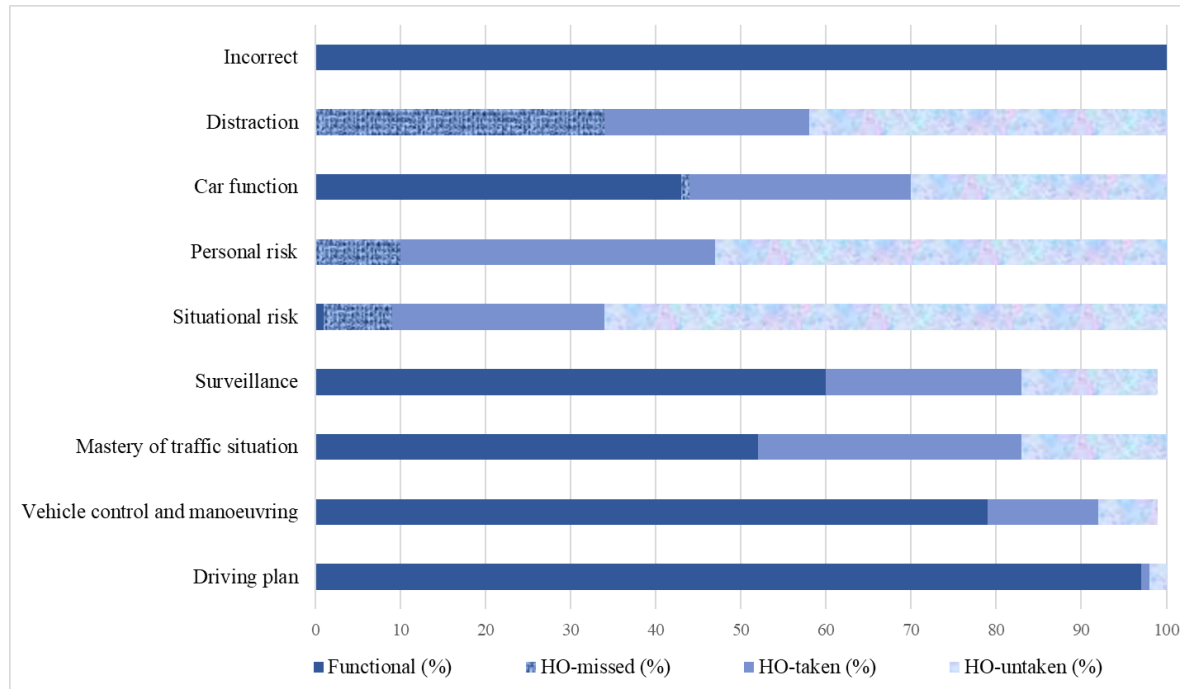

↑ negative emotions

↑ pressure from others

– overtaking, tailgating, speeding

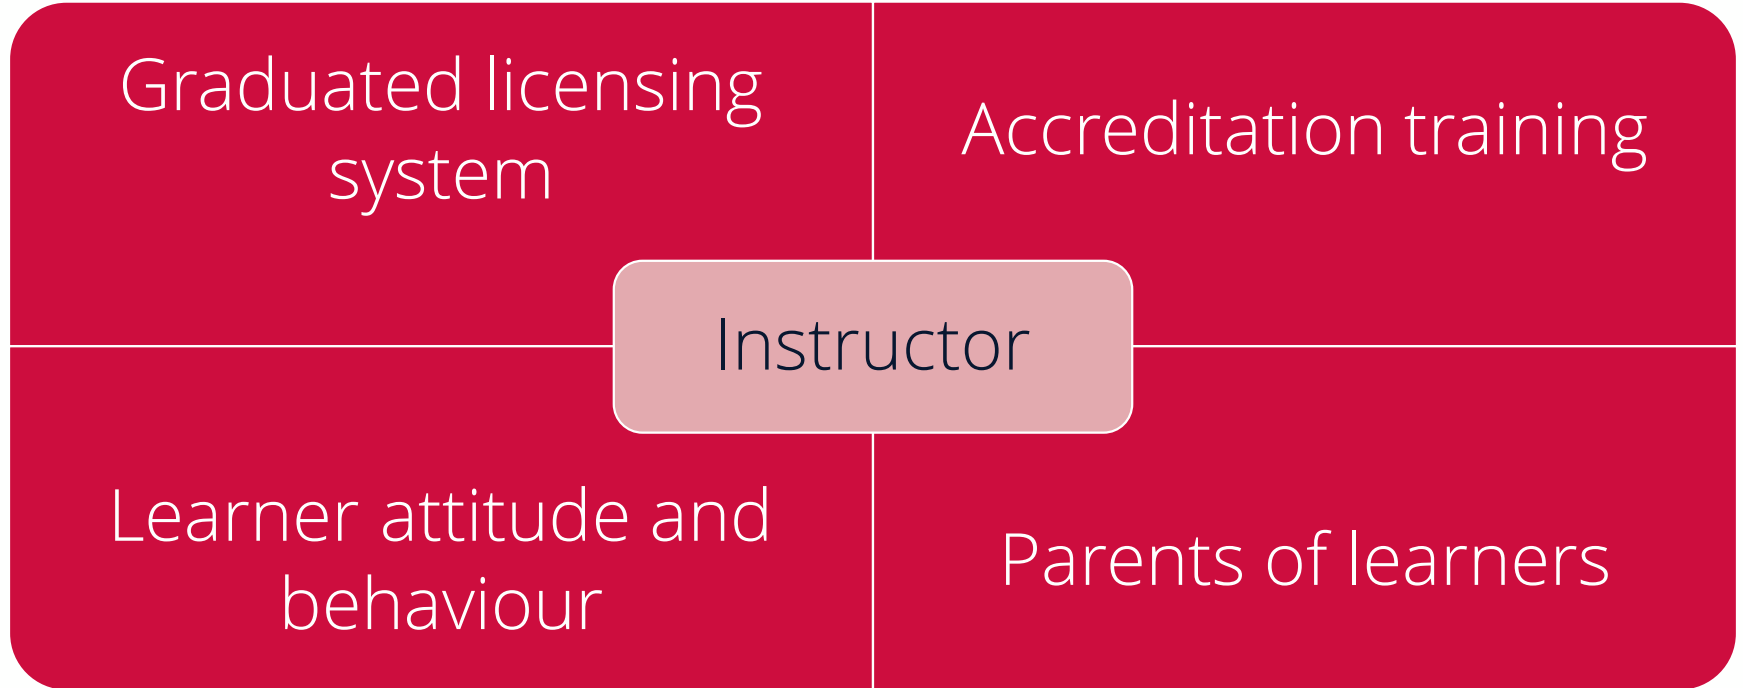

➤ ↑ L self-regulated safety orientation

Observation of Learner Lessons

Watson-Brown et al., 2020

Driving Instructor Interviews

Graduated licensing system

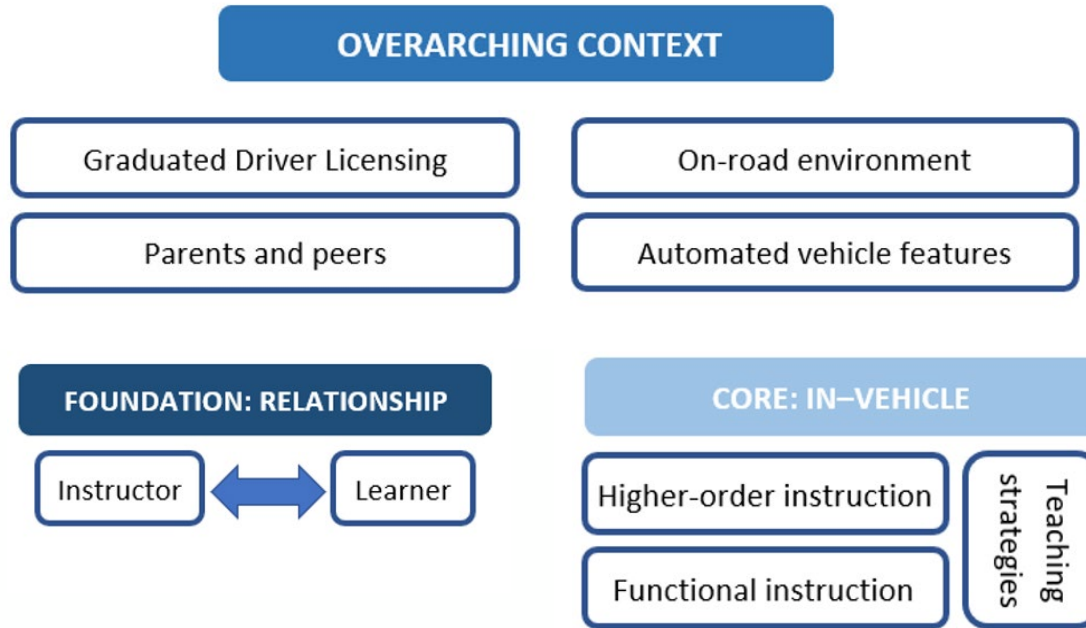

Accreditation training

Instructor

Learner attitude and behaviour

Parents of learners

HOT-CAR Model

Application of the Model: Learner

Example 1

Learner: I guess I could go now.

Instructor: Should we guess? It is kind of an important decision, I don't want you guessing,

I want you to be able to land a jumbo jet in the gap that you are going to choose.

Pretend you are driving a double decker bus; that is the gap that you need

Dissecting Example 1

Mastery of Traffic Situation

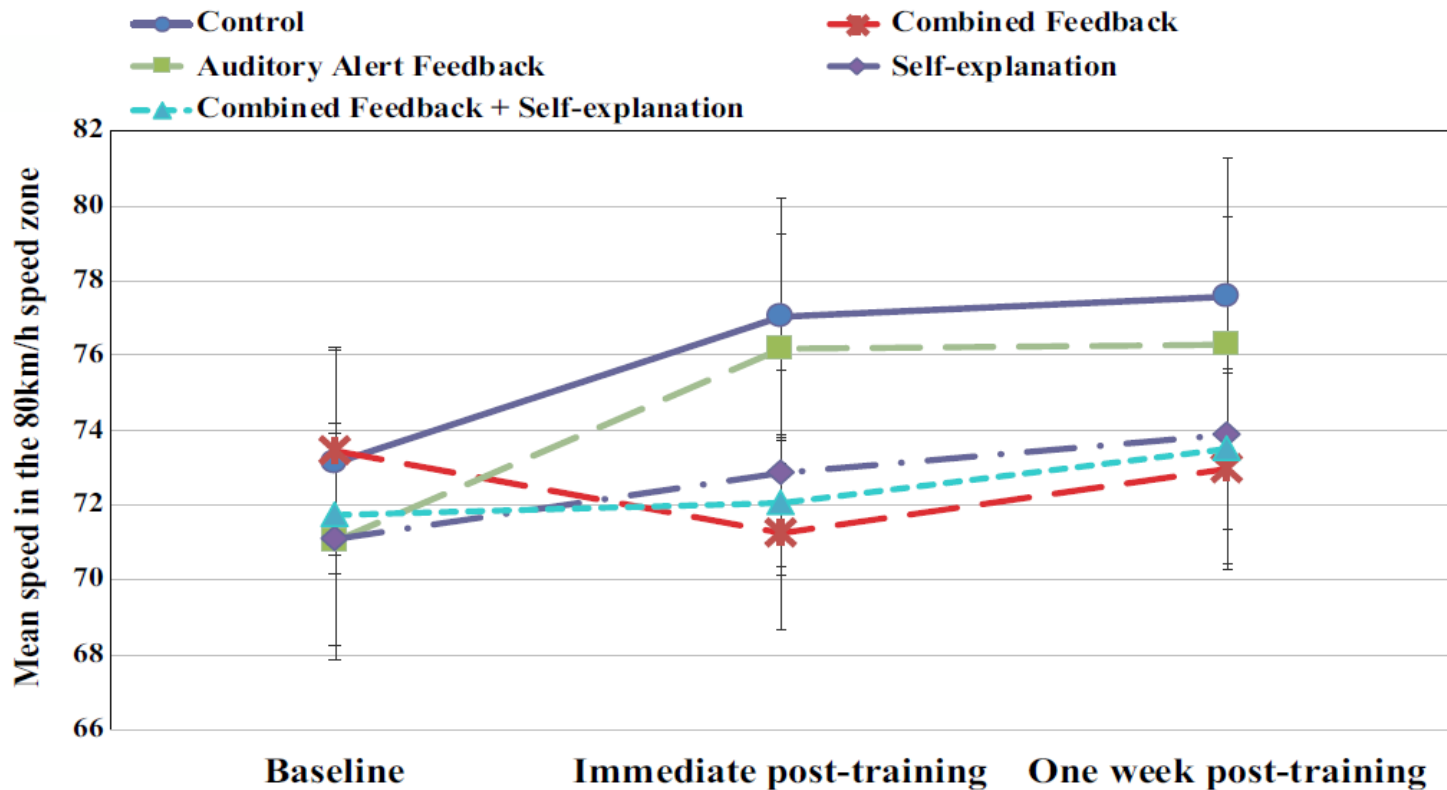

Coaching strategies

Driving task reflection; Autonomy supportive; Specific feedback;
Encouraging self-awareness; Relatedness; Homework

Targeted higher-order skills

Decision-making – judgement; Situation awareness; Risk awareness

P driver Example

Conclusions

Healthy development, lifestyle, inexperience inflate risk

- Most young people intend to drive safely
- High risk-takers few, mostly short-lived

Training Ls: higher-order, self-regulation

- Beyond passing test, reduces risky driving

Feedback, coaching

- Self-reflection, self-regulation
